Deployment

Frontend Deployment:

1. Ensure the frontend code compiles and runs without any compiler or lint errors.
2. Run `npm run build` in the root project directory and include the files in the `dist/`directory in your pull request. When your PR is merged, these files will be deployed to AWS.

Backend Deployment:

1. Ensure the backend code compiles and runs without any compiler or lint errors.
2. Make sure to add any new dependencies to BOTH environment.yaml and requirements.txt
3. Make sure all automated tests pass without any errors.
4. Include the modified backend files in your PR. When your PR is merged, these files will be deployed to AWS.

The newly deployed version of the app should then be available here
