<u>Working Prototype Known Problems Report</u>
Social Stock
Team: Gurpinder Singh, Mihika Marathe, Nout Reusken, Ojas Upadhye, Qiuxia Tang

1. Comments allowed on Invalid Tickers
   a. The social component still appears when an invalid ticker is searched. It also allows comments to be added for this invalid ticker.
   b. There is a message provided at the top of the page that the ticker is invalid which will hopefully deter the user from socially engaging.
   c. Solution: We could potentially set a state which reflects whether or not the ticker that was searched was valid. We could then condition the component on that variable.
2. Lint errors
   a. There may be a few unresolved lint errors.
   b. Solution: Make the formatting changes that came up last minute.
3. Console warnings
   a. There are a few warnings in the console related to similar aria-labels and ids.
   b. There is a warning about the anchorEl variable for the menu.
4. Deployment Market Filters Error
   a. The Market Filters page does not update based on selection on the deployed version.
   b. This is caused by an issue related to the javascript webpack.
   c. A potential fix would be to go through and better understand the dependencies.
